20.0.0.0/16. The user can create subnets as per the requirement within a VPC. If the user wants to connect VPC from his own data center, he can setup a public and VPN only subnet which uses hardware VPN access to connect with his data center. When the user has configured this setup with Wizard, it will create a virtual private gateway to route all traffic of the VPN subnet. If the virtual private gateway is attached with VPC and the user deletes the VPC from the console it will first detach the gateway automatically and only then delete the VPC.

**NEW QUESTION: 2**

`RMAN > BACKUP DATABASE PLUS ARCHIVELOG;`

- A. Option D
- B. Option B
- C. Option A
- D. Option C

**Answer: B**

Explanation:

Explanation

Backing Up a Whole CDB

Backing up a whole CDB is similar to backing up a non-CDB. When you back up a whole CDB, RMAN backs up the root, all the PDBs,

and the archived redo logs. You can then recover either the whole CDB, the root only, or one or more PDBs from the CDB backup.

Note:

\* You can back up and recover a whole CDB, the root only, or one or more PDBs.

\* Backing Up Archived Redo Logs with RMAN

Archived redo logs are the key to successful media recovery. Back them up regularly. You can back up logs with BACKUP ARCHIVELOG, or back up logs while backing up datafiles and control files by specifying BACKUP ... PLUS ARCHIVELOG.

### **NEW QUESTION: 3**

The fact that a network-based IDS reviews packets payload and headers enables which of the following?

- A.** Detection of all password guessing attacks
- B.** Detection of data corruption
- C.** Detection of all viruses
- D.** Detection of denial of service

**Answer: D**

Explanation:

Explanation/Reference:

Explanation:

An Intrusion Detection System (IDS) is a system that is used to monitor network traffic or to monitor host audit logs in order to determine if any violations of an organization's security policy have taken place. An IDS can detect intrusions that have circumvented or passed through a firewall or are occurring within the local area network behind the firewall.

A network-based IDS usually provides reliable, real-time information without consuming network or host resources. A network-based IDS is passive while it acquires data. Because a network-based IDS reviews packets and headers, denial of service attacks can also be detected. Furthermore, because this IDS is monitoring an attack in realtime, it can also respond to an attack in progress to limit damage.

Incorrect Answers:

B: A network-based IDS does not detect viruses.

C: A network-based IDS does not detect data corruption.

D: A network-based IDS does not detect all password guessing attacks.
