Answer: D

Explanation:
https://cloud.google.com/storage/docs/request-rate
Use a naming convention that distributes load evenly across key ranges

Auto-scaling of an index range can be slowed when using sequential names, such as object keys based on a sequence of numbers or timestamp. This occurs because requests are constantly shifting to a new index range, making redistributing the load harder and less effective.

In order to maintain a high request rate, avoid using sequential names. Using completely random object names will give you the best load distribution.
