Answer: A

Explanation:

Amazon RDS Multi-AZ deployments provide enhanced availability and durability for Database (DB) Instances, making them a natural fit for production database workloads. When you provision a Multi-AZ DB Instance, Amazon RDS automatically creates a primary DB Instance and synchronously replicates the data to a standby instance in a different Availability Zone (AZ). Each AZ runs on its own physically distinct, independent infrastructure, and is engineered to be highly reliable. In case of an infrastructure failure (for example, instance hardware failure, storage failure, or network disruption), Amazon RDS performs an automatic failover to the standby, so that you can resume database operations as soon as the failover is complete. Since the endpoint for your DB Instance remains the same after a failover, your application can resume database operation without the need for manual administrative intervention.

NEW QUESTION: 3

Which module is NOT a valid component of Cisco AnyConnect Secure Mobility Client for Windows?

- A. VPN Module
- B. Profiling Module
- C. Network Access Manager
- D. Telemetry Module

Answer: B

Explanation:

Section: (none)

Explanation/Reference:

Explanation:

These are the VPN modules in Cisco Anyconnect client:

Network Access Manager

Posture Module

Telemetry Module

WebSecurity Module

NEW QUESTION: 4

Tom is the project manager of the GHQ Project for his organization and he is working on recovering the project schedule. As Tom examines his schedule, he is especially aware of project activities with hard logic. What is hard logic?

- A.** Hard logic describes activities that have external constraints, such as a vendor.
- B.** Hard logic describes activities that must be completed in a particular order unless additional resources with comparable skill sets can be added to the project.
- C.** Hard logic describes activities that must be completed in a particular order.
- D.** Hard logic describes activities that can be completed in any order but are positioned with finish-to-start relationships.

Answer: C

Explanation:

Hard logic, also known as mandatory dependencies, describes activities that must be completed in a particular order. Hard logic is a binding connection between activities. It is also known as mandatory dependency or hard dependency. Hard logic requires activities to take place in a specific order according to the nature of work. It is a well-built connection where an activity cannot start until and unless a previous one is completed. There are also substantial hard logic connections where soft logic does not usually apply. Several activities rely on hard logic for the successful completion of the project. Answer options B, A, and C are incorrect. These are not a valid description of hard logic.
