B. The spanning-tree portfast trunk command must be removed.
C. The trunk port does not have the correct VLANs allowed.
D. The switchport mode must be configured as access.
Answer: C

NEW QUESTION: 3
BPM capability maturity levels describe_____.
A. the capabilities of the BPM business analyst
B. the length of time the BPM application has been in production
C. the strategic and tactical levels of enterprise adoption of BPM
D. BPM concepts, consistently applied, facilitating sharing and reuse
Answer: C
Explanation:
Capability Maturity Model (CMM) broadly refers to a process improvement approach that is based on a process model.
A maturity model can be used as a benchmark for assessing different organizations for equivalent comparison. It describes the maturity of the company based upon the project the company is dealing with and the clients.
The Capability Maturity Model includes the concept of Maturity Levels: a 5-level process maturity continuum - where the uppermost (5th) level is a notional ideal state where processes would be systematically managed by a combination of process optimization and continuous process improvement.
There are five levels defined along the continuum of the CMM and, according to the SEI: "Predictability, effectiveness, and control of an organization's software processes are believed to improve as the organization moves up these five levels. While not rigorous, the empirical evidence to date supports this belief.
1.Initial (chaotic, ad hoc, individual heroics) - the starting point for use of a new or undocumented repeat process.
2.Repeatable - the process is at least documented sufficiently such that repeating the same steps may be attempted.

3.Defined - the process is defined/confirmed as a standard business process, and decomposed to levels 0, 1 and 2 (the latter being Work Instructions).
4.Managed - the process is quantitatively managed in accordance with agreed-upon metrics.
5.Optimizing - process management includes deliberate process optimization/improvement.
